

Assignment 6

Exercise 1

The program print = 7, 18, 2

Exercise 3

PART A

PART C

The program should print every data-value in the list. However, the function fails to traverse through the list and are stuck on the first node.

To pick the next node the line: $p = p \rightarrow next$ should be added after the print-statement to point at the next node. Then every node.data should be printed correctly and the postcondition is therefore fulfilled.
